Hello,

The following submission has been created.

Track Name: ICDCS2024

Paper ID: 776

Paper Title: DESIGN AND IMPLEMENTATION OF DUAL BAND RECONFIGURABLE FLEXIBLE ANTENNA FOR WIRELESS APPLICATIONS

Abstract:

In order to feed the world's expanding population, agriculture is becoming more important. However, a major obstacle for farmers is still managing resources effectively and optimizing crop production. This study suggests a novel Internet of Things (IoT) device that can detect changes in soil conditions and give precise crop recommendations, powered by machine learning. The device gathers real-time data on soil composition, moisture, humidity, temperature, and borewell water level levels using the soil moisture sensor, the DHT11 sensor, and the water level sensor. Through the Node MCU with DBR flexible antenna and the MQTT protocol, the gathered data is sent to a server. Machine learning algorithms analyze the collected data based on crop requirements and soil nutrients. They then offer personalized recommendations, like a list of possible high-yielding crops, fertilizer names and amounts, and more .

Authors:

- sandytrf9061@gmail.com (Primary)
- sindhukavisakthi@gmail.com

Primary Subject Area: Antennas, Microwave, and RF

Secondary Subject Areas: Not Entered

Submission Files: BRUNO JOURNAL PAPER (2).docx (321 Kb, Thu, 14 Mar 2024 06:39:19 GMT)

Submission Questions Response: Not Entered

Thanks,
CMT team.
